comply with the Handbook standards for development projects. The Handbook lists 10 standards covering both mitigation and renovation of stormwater runoff. A full discussion on the project compliance with the standards can be found at the end of this report. However, the following section will summarize the project's compliance with the mitigation standards 1 and 2 of the Handbook relating to reducing peak rates of runoff and creating no adverse down gradient impacts.

To demonstrate that there will be no downstream impacts because of developing the site, a stormwater analysis was performed using the U.S. Soil Conservation Service (S.C.S) method of analysis contained in Technical Release #20 (TR-20) published by the U.S. Conservation Service, along with the precipitation values listed in Boxford's Stormwater Management Bylaw. The software application HydroCAD was utilized to analyze the pre and post-development watershed conditions.

The following is a listing of the total pre-and post-development rates of stormwater runoff for the primary Design Points for the 2, 10, 25, 50 and 100-year rainfall events. The dedicated vernal pool Design Points (2A, 3A & 5A) were not individually analyzed because they are tributary to other Design Points (2, 3 & 5) as described previously.
